## Myriad of new classes of discovery tools

New Scholarly search citation indexes (Cross Disciplinary)

### New mega citation indexes

### Science mapping tools

### Research Graphs

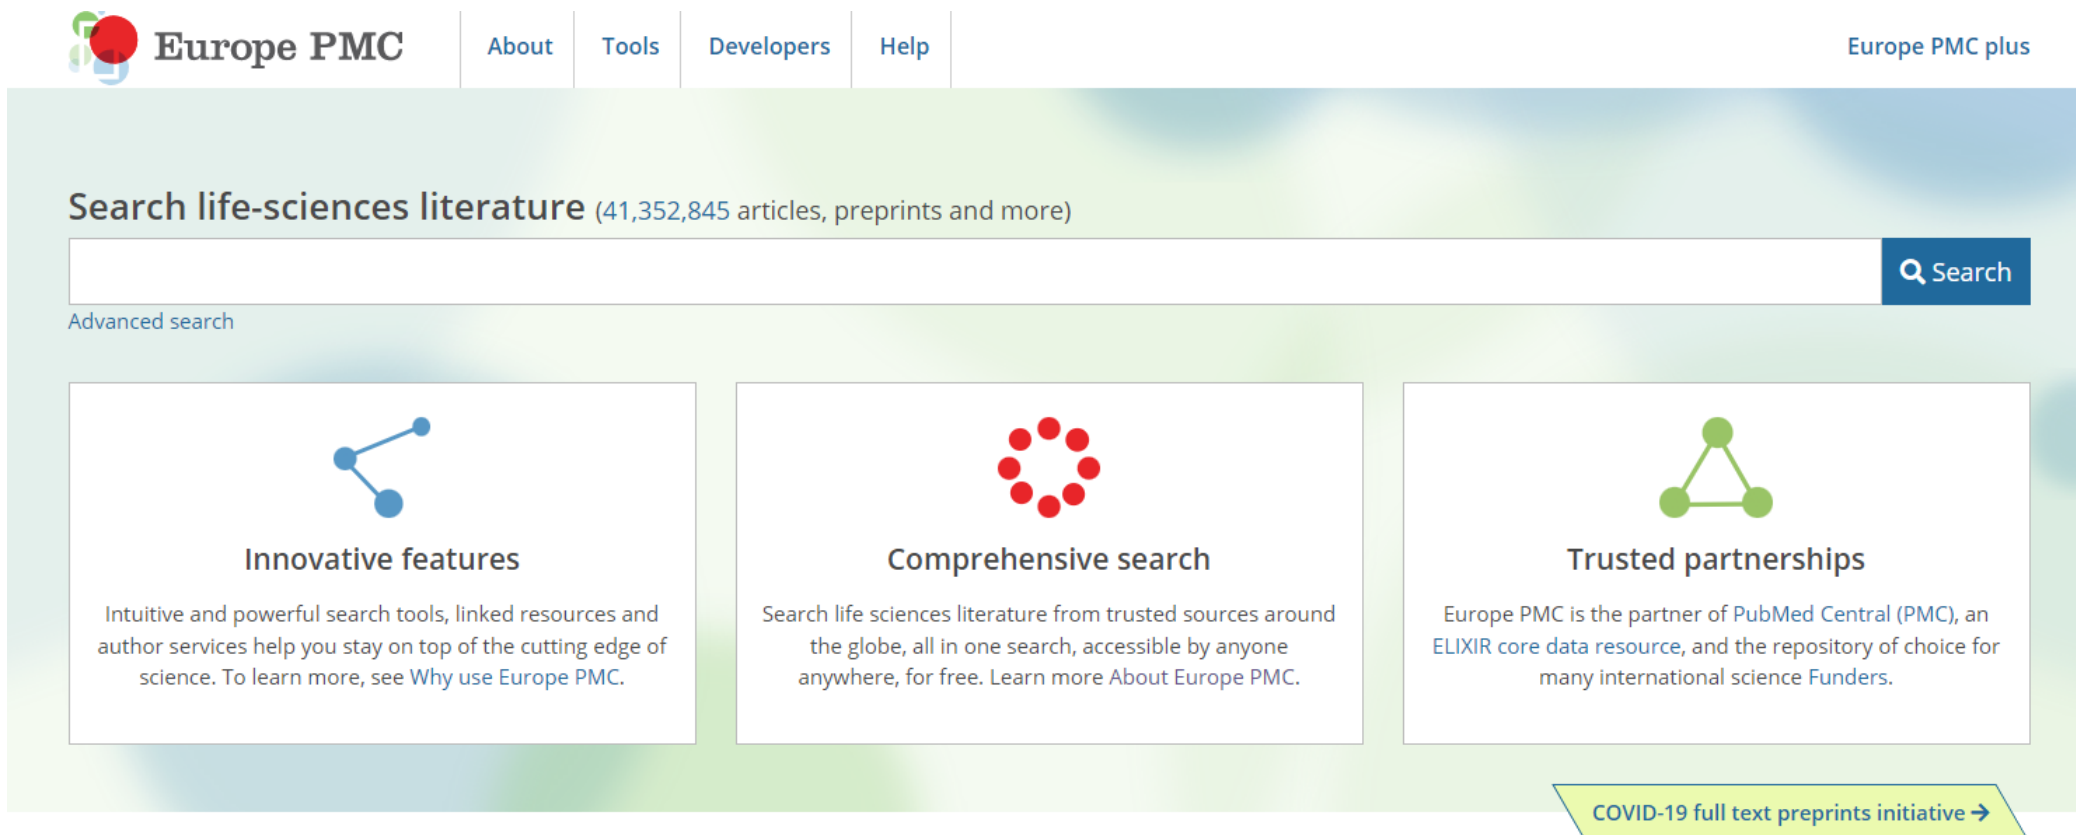

### Citation based literature mapping services

### Full-text extraction

Which tools or databases do you typically use to search for scientific literature?

<https://ahaslides.com/HKUST>

# Europe PMC - Can we also have something like this outside the biomedical fields?

The screenshot shows the Europe PMC website interface. At the top, there is a navigation bar with the Europe PMC logo, a menu with links for 'About', 'Tools', 'Developers', and 'Help', and a link for 'Europe PMC plus'. Below the navigation bar is a large search area with the heading 'Search life-sciences literature (41,352,845 articles, preprints and more)'. It features a search input field and a 'Search' button. Below the search bar is a link for 'Advanced search'. The main content area is divided into three columns, each with an icon and a title: 'Innovative features' (with a blue network icon), 'Comprehensive search' (with a red circular icon), and 'Trusted partnerships' (with a green triangle icon). Each column contains a brief description of the feature. At the bottom right, there is a yellow banner for the 'COVID-19 full text preprints initiative' with a right-pointing arrow.

Europe PMC

About Tools Developers Help

Europe PMC plus

Search life-sciences literature (41,352,845 articles, preprints and more)

Search

Advanced search

**Innovative features**

Intuitive and powerful search tools, linked resources and author services help you stay on top of the cutting edge of science. To learn more, see [Why use Europe PMC](#).

**Comprehensive search**

Search life sciences literature from trusted sources around the globe, all in one search, accessible by anyone anywhere, for free. [Learn more About Europe PMC](#).

**Trusted partnerships**

Europe PMC is the partner of [PubMed Central \(PMC\)](#), an [ELIXIR core data resource](#), and the repository of choice for many international science [Funders](#).

The Leiden Manifesto  
for research metrics

Use these ten principles to guide research evaluation, urge **Diana Hicks**, **Paul Wouters** and colleagues.

# Responsible research assessment: Policy initiatives in the Netherlands and Europe

## Room for everyone's talent towards a new balance in the recognition and rewards of academics

## Coalition for Advancing Research Assessment

Our vision is that the assessment of research, researchers and research organisations recognises the diverse outputs, practices and activities that maximise the quality and impact of research. This requires basing assessment primarily on qualitative judgement, for which peer review is central, supported by responsible use of quantitative indicators.

# UNESCO Recommendation on Open Science: Responsible research assessment

**UNESCO Recommendation  
on Open Science**

Reviewing research assessment and career evaluation systems in order to align them with the principles of open science. Considering that a commitment to open science requires time, resources and efforts that cannot be automatically converted into traditional academic output, such as publications, but which can have a significant impact on science and society, evaluation systems should take into account the wide breadth of missions within the knowledge creation environment. These missions come with different forms of knowledge creation and communication, not limited to publishing in peer reviewed international journals.

Encouraging responsible research and researcher evaluation and assessment practices, which incentivize quality science, recognizing the diversity of research outputs, activities and missions.

# How to facilitate responsible research assessment

To facilitate responsible research assessment, we need research analytics that are

**Transparent**

**Pluralistic**

**Democratic**

This requires openness of research information

# UNESCO Recommendation on Open Science: Infrastructures for open research information

**UNESCO Recommendation  
on Open Science**

**Open science infrastructures** refer to shared research infrastructures (virtual or physical, including major scientific equipment or sets of instruments, knowledge-based resources such as collections, journals and open access publication platforms, repositories, archives and scientific data, current research information systems, open bibliometrics and scientometrics systems for assessing and analysing scientific domains, open computational and data manipulation service infrastructures that enable collaborative and multidisciplinary data analysis and digital infrastructures) that are needed to support open science and serve the needs of different communities. Open labs, open science platforms and repositories for publications, research data and source codes, software forges and virtual research environments, and digital research services, in particular those that allow to identify unambiguously scientific objects by persistent unique identifiers, are among the critical components of open science infrastructures, which provide essential open and standardized services to manage and provide access, portability, analysis and federation of data, scientific literature, thematic science priorities or community engagement. Different repositories are adapted to the

## Initiative for Open Abstracts

**The Initiative for Open Abstracts (I4OA)** is a collaboration between scholarly publishers, infrastructure organizations, librarians, researchers and other interested parties to advocate and promote the unrestricted availability of the abstracts of the world's scholarly publications, particularly journal articles and book chapters, in trusted repositories where they are open and machine-accessible. I4OA calls on all scholarly publishers to open the abstracts of their published works, and where possible to submit them to Crossref.

# Availability of open metadata in Crossref

## Crossref as a source of open bibliographic metadata

[Nees Jan van Eck](#) and [Ludo Waltman](#)

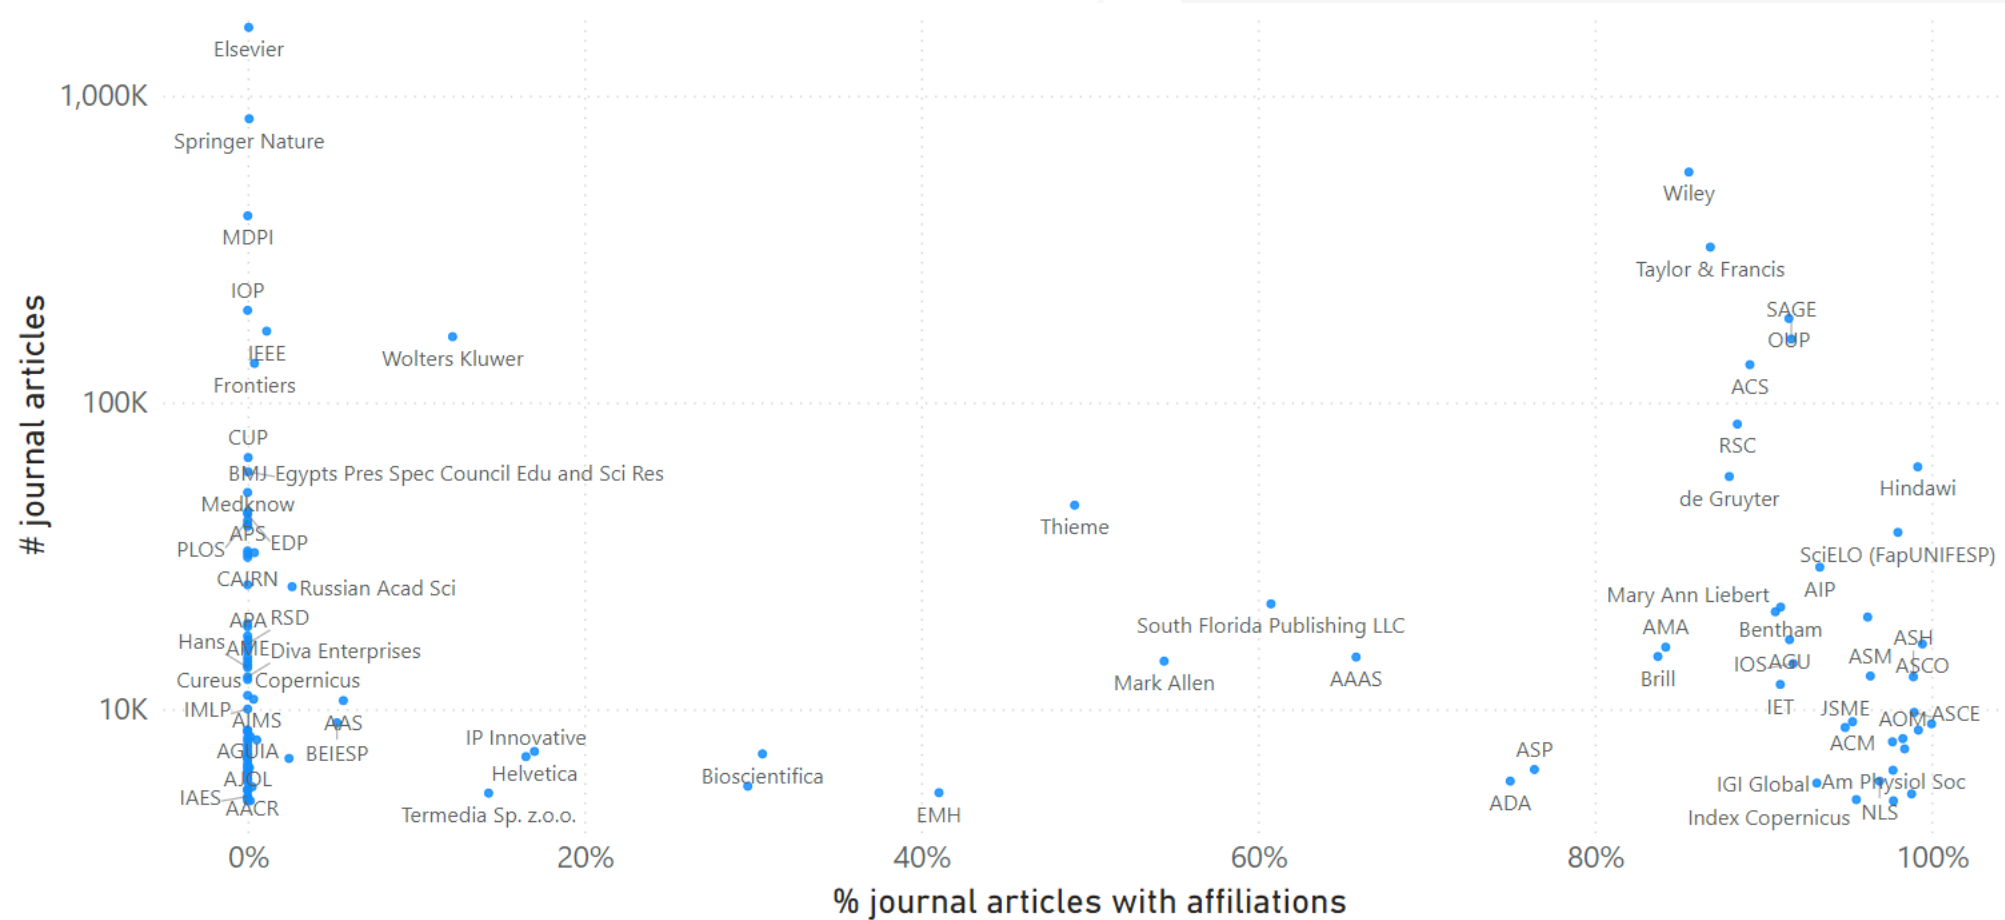

Centre for Science and Technology Studies, [Leiden University](#), The Netherlands  
{ecknjpvan, waltmanlr}@cwts.leidenuniv.nl

Several initiatives have been taken to promote the open availability of bibliographic metadata of scholarly publications in Crossref. We present an up-to-date overview of the availability of six metadata elements in Crossref: reference lists, abstracts, ORCIDs, author affiliations, funding information, and license information. Our analysis shows that the availability of these metadata elements has improved over time, at least for journal articles, the most common publication type in Crossref. However, the analysis also shows that many publishers need to make additional efforts to realize full openness of bibliographic metadata.

## Publications should be FAIR

📅 October 26, 2020 • 📖 Opinion & Commentary • ⌚ 3 min read

Scholarly data sets are increasingly expected to be FAIR (findable, accessible, interoperable, and reusable). To fully realize the benefits of open access to the scholarly literature, Ludo Waltman argues that publications should be FAIR as well.

EDITORIAL | 13 September 2022

## Citation data are now open, but that's far from enough

The reference lists of more than 60 million papers on the linking site Crossref are now openly available. That is welcome – but further steps must follow.

Assessing how papers cite each other has been a painful business until now. Credit: Getty

Depositing all relevant metadata on Crossref should become the norm in scholarly publishing, as should generating DOIs for every paper. For those publishers that don't have the time or resources to do this, I4OC, I4OA and others in the open-science community have declared themselves ready to offer assistance.

Ultimately, all these moves must be only steps towards the goal of having all research papers openly available in their entirety. But until we arrive at that point, they are key to the transparency and reproducibility of research. They should be supported by all.

# PID graphs

## Introducing the PID Graph

February 2022

## Introduction

Picture this:

- A postdoctoral researcher in marine biology is hired on the basis of her impressive h-index and citation count;
- A university committee decides which NWO Gravity proposal to submit, based on a predictive analytics tool that utilises global trends in grant awards;
- A government panel for the Dutch *Nationaal Groeifonds* makes its selection based on metrics provided by a commercial company;
- A journal editor publishes controversial research, hoping to raise the impact factor of her journal.

But what if not all publishing venues for marine biology are equally well covered by the underlying data sources? And what if her high scores resulted from choosing a large commercial publisher over an academic society to publish the work? And how about potential biases included in the algorithms that shaped the decision of the university committee? And did the metrics of the commercial company

123/45/7

**GP1.**  
Trusted and  
transparent provenance

*"Within any infrastructure or service for research metadata, the provenance of the metadata, and the related algorithms, must be clear."*

**GP2.**  
Openness  
of Metadata

*"Knowledge institutions must release metadata related to research output as openly as possible, ideally as CC0."*

**GP3.**  
Openness  
of Algorithms

*"Algorithms and other techniques and methodology used to analyse and report on scholarly outputs must be available for public inspection."*

**GP4.**  
Enduring access  
and availability

*"Knowledge institutes and third-party services must facilitate complete, non-discriminatory and enduring access to primary metadata and enriched metadata without functional, technical, legal, or financial limitations."*

**GP5.**  
Open Standards  
& Interoperability

*"All stakeholders must agree to work towards common definitions and open standards for exchanging and describing both metadata and algorithms."*

**GP6.**  
Open collaboration  
with Third parties

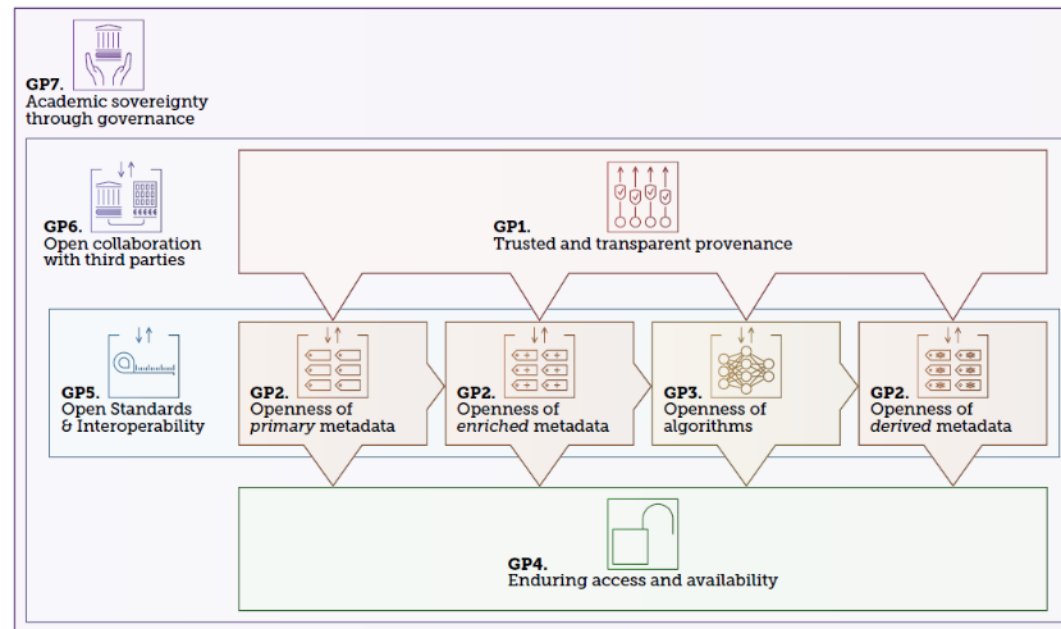

*"Knowledge institutions and third parties must engage in open collaboration where innovation, competition, and public value are recognised and respected cornerstones."*

**GP7.**  
Academic sovereignty  
through governance

*"A suitable governance structure must be established in order to fully implement the principles, and to ensure that stakeholders remain engaged and share accountability towards the community goals and values."*

c o n c l u s i o n

Conclusions and recommendations

# Conclusion:

## How we can all contribute and benefit

- **Students and researchers:** Publish your research in venues that are open access and that support open metadata
- **Students and researchers:** Take advantage of open scholarly infrastructures for literature discovery
- **Librarians and administrators:** Support open scholarly infrastructures
- **Librarians and administrators:** Require open access and open metadata in your negotiations with publishers
- **Librarians, administrators and evaluators:** Use open research information to promote transparency, plurality and democracy in research assessments
- **Students:** Lots of very exciting career opportunities in this area!

THANK  
YOU

Thank you for your attention!
